

A Security Strategy Review Framework

Take a holistic approach to reviewing security strategy and measure outcomes

To walk the talk when it comes to thinking security-first, you must review each area of the business. Organizations are more interconnected and fast-moving than ever. It's important to take a wide perspective and review all angles of security across governance, people, process, and technology and then measure outcomes for effectiveness.

1. Governance levels vary from company to company

Evaluate what you have in place and consider adding new structures for data protection for the long term depending on your organization's key factors.

2. People are an organization's greatest vulnerability

They can also be its strongest line of defense. Review your education and training for cybersecurity best practices, and make sure your people are part of the solution.

3. Go beyond security to business-level processes

Review data-related processes to understand the scope of securing that data, but also evaluate other departmental workflows to identify areas to add new security measures.

4. Technology is the backbone of your digital organization

It's important to assess how your systems are actually used by staff and consider changes if people tend to bypass standard procedures to avoid any inconvenient steps required.

Culture of Security Tips

McAfee can help you stay up to date

Businesses have too much to lose if they don't prioritize security at every level. With more data to protect and cyber threats evolving, everyone must play a part in creating a culture of security.
